CUSTOMER SUCCESS & SALES ANALYTICS

EXECUTIVE BUSINESS REPORT

Customer Churn & Retention Strategy

Prepared by	Sonu Kumar Thakur
Role	Data Analyst Intern, Securozen
Date	October 2026
Project domain	Customer Success & Sales Analytics

Executive Snapshot

This report examines customer churn patterns in a dataset containing 100,000 customer records. It summarizes the reported churn rate, highlights segments associated with elevated attrition, and proposes practical retention initiatives for business stakeholders.

33.14%	100,000	5
Reported overall churn rate	Customer records analyzed	Strategic initiatives proposed

Management takeaway: Prioritize early-tenure customers, month-to-month contracts, electronic-check users, and high-charge customers without long-term commitments. Validate the underlying drivers before launching offers or changing pricing.

1. Executive Summary

The objective is to identify customer groups with elevated churn, understand patterns associated with attrition, and recommend actions that may improve retention and protect recurring revenue. The analysis is described as using Python-based exploratory data analysis and Power BI metrics. The findings below reflect the supplied project summary and should be validated against the underlying dataset and dashboard before being used as causal claims or operational decisions.

2. Key Analytical Findings — The “Why”

01 **Overall churn is elevated**
The reported overall churn rate is 33.14%—approximately one in three customers. This indicates a material retention challenge and makes churn reduction a relevant business priority.

02 **Month-to-month contracts show higher risk**
Customers on month-to-month plans are reported to churn more frequently than customers on one-year or two-year contracts. Contract flexibility may be associated with lower switching barriers; the dashboard should confirm the size of the difference.

03 **Electronic-check users have the highest reported churn**
The analysis identifies electronic-check customers as a high-churn segment compared with customers using automated payment methods. Payment method may be a marker of other customer differences, so it should not be treated as a proven cause.

04 **Early tenure is a potential intervention window**
The reported trend shows churn concentrated in the first months of the customer lifecycle. This pattern warrants closer review of onboarding, product adoption, support contacts, and early customer expectations.

05 **High monthly charges may increase revenue exposure**
Customers with higher monthly charges and no long-term contract are described as particularly susceptible to churn. If validated, this group deserves priority because its departure may put more recurring revenue at risk.

3. Strategic Recommendations — The “Action Plan”

01. Encourage longer-term subscriptions

Test targeted upgrade offers for eligible month-to-month customers, such as a transparent 10–15% introductory discount or added features for annual commitments. Model margin impact and compare conversion and retention against a control group before scaling.

02. Strengthen the first 90 days

Introduce a structured onboarding program with welcome communication, guided setup, relevant tutorials, early usage checks, and proactive support. Track activation, support resolution, and churn by onboarding cohort.

03. Make automated payments easier

Test a low-cost incentive or clear enrollment journey for customers who choose eligible automatic payment methods. Confirm payment-processing economics and measure adoption and subsequent churn; avoid assuming payment method itself causes attrition.

04. Build a risk-based retention workflow

Create a monitored segment of high-monthly-charge customers on month-to-month plans. Use a transparent rules-based flag initially, then evaluate a validated churn model if sufficient historical data is available. Trigger timely, personalized outreach and measure saved revenue.

05. Capture cancellation reasons

Offer a short, optional exit survey with reasons such as price, service quality, product fit, billing, and competitor choice, plus an open-text field. Review responses regularly and connect themes to customer segments and follow-up actions.

4. Suggested Measurement Plan

Use a controlled rollout where possible. Establish a baseline, define a measurement window, and compare results with a comparable control group before declaring an initiative successful.

Initiative	Primary KPI	Guardrail / Check
Annual-plan offers	Upgrade rate; churn by contract cohort	Discount cost; gross margin
90-day onboarding	90-day retention; activation	Support workload; cohort mix
Auto-pay enrollment	Enrollment rate; subsequent churn	Payment fees; failed payments
Risk-based outreach	Retention rate; revenue retained	Offer cost; false-positive rate
Exit survey	Survey response; reason distribution	Response bias; data privacy

5. Conclusion

The reported 33.14% churn rate highlights a need for focused retention analysis. The strongest immediate opportunities to investigate are month-to-month customers, early-tenure customers, electronic-check users, and higher-charge customers without long-term commitments. A measured combination of onboarding support, targeted contract offers, payment choice improvements, proactive outreach, and exit feedback can help the business test what works and direct retention spending where it has the greatest impact.

Limitations: The supplied summary does not include the underlying data, segment-level churn percentages, statistical tests, or model validation results. Associations described in this report should not be interpreted as proof of causation. All figures and findings should be checked against the final dashboard and source data.

Prepared using the project summary of Python-based exploratory data analysis and Power BI data modeling. Recommendations are proposed actions, not claims of measured impact.
